### GeV PWN Search

- + Known high-energy PWNe
  - + From X-ray and TeV observations
  - + Crab, Vela X, MSH 15-52 nebulae...
- + Off-peak searches of gamma-ray pulsars
  - + Catalog from LAT team underway
- + Young, energetic radio pulsars
- + TeV nebula candidates

May 28, 2010 E. Hays

### Crab Pulsar and Nebula

#### Pulsar 100 MeV to 20 GeV

PRELIMINARY

Hyper-exponential cutoff excluded at  $\sim 5$  sigma. Consistent with emission well above the neutron star surface

#### Nebula from MeV to TeV

PRELIMINARY

Inverse Compton emission consistent with mean magnetic field in nebula  $100 \mu\text{G} < B < 200 \mu\text{G}$

May 28, 2010 E. Hays

Abdo, A. A. et al. 2010, ApJ, 708, 1254

### Vela X: Nebula of the Vela Pulsar

Excess counts  $E > 800$  MeV

Profile

Data compared with a simulated point source at position of Vela Pulsar

May 28, 2010 E. Hays

Abdo, A. A. et al. 2010, ApJ, 713, 146

### MSH 15-52

$E \sim 1$  GeV

$E \sim 10$  GeV

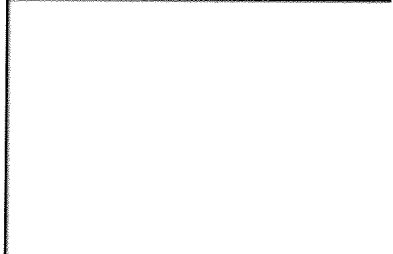

$E$  [GeV]  $\log \text{cm}^{-2} \text{s}^{-1}$

Energy [eV]

Legend:  $\bullet$  decay,  $\circ$  synchrotron,  $\square$  on Crab,  $\triangle$  on MSH,  $\diamond$  on straight,  $\times$  MSH

## Supernova Remnants

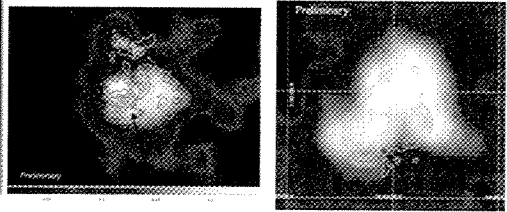

May 28, 2010

E. Hays

## Resolved GeV Sources

Bright gamma-ray sources associated with several supernovae interacting with molecular clouds  
Extension resolved in LAT data

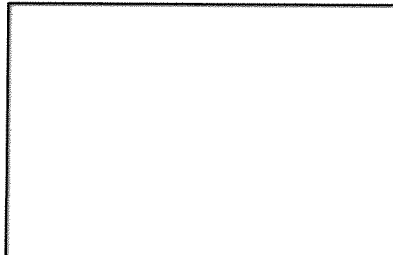

LAT counts map (2-8 GeV)  
X-ray (0.1-2.4 keV, black) and  
radio (1.4 GHz, green) contours

LAT counts map (2-10 GeV)  
Radio (1.4 GHz, green) contours

# Gamma rays from a Nova

- + Fermi J2102+4542
- + Located in the direction of the Cygnus region
- + Bright, high confidence, detected over several days by automated processing
- + No likely blazars in error circle...

May 28, 2010

E. Hays

# V 407 Cygni - a symbiotic nova

+ Position and timing consistent with V 407 Cygni, a recurrent nova detected in outburst ~2 days before the Fermi report

AAVSO Data & HST WISE/ Cyg - WWW.AAVSO.ORG

# V407 Cygni: a variable star

**Symbiotic binary:**  
White dwarf star and red giant star  
orbiting each other

Near Deneb in Cygnus

- Mira variable star
- White dwarf accretion
- Binary interaction

A complex and fascinating system!

V407 Cyg ~ 6000 light years  
away

May 28, 2010

©. Hays

# March 11 - A Nova!

Hydrogen accreting on to the surface of the white dwarf ignites a nuclear explosion (30-60 of these per year in Milky Way)

Candidate nova discovered by amateur astronomers, Nishiyama and Kobashima

Fermi detects a new gamma-ray source in the same field on March 13 (ATEL #2487)

Usually below here

Optical lightcurve

Spectrum does not look typical - a **sympiotic recurrent nova?**

Very few systems explode on decade timescales (RS Ophiuchi ~ 20 yr period)

May 28, 2010 E. Hays

## Symbiotic Nova

- + Symbiotic Binary System: White dwarf + red giant system
- + Nova: White dwarf builds up mass envelope to the point of thermonuclear fusion
  - + Dramatic increase in visual magnitude
- + Recurrent Nova?
  - + Hints but no strong confirmation of previous nova
- + Pre-nova activity
  - + White dwarf shows ongoing variability at level of several in magnitude
  - + V407 Cyg companion is a Mira star showing variability at level of several in magnitude
    - + Dusty environment with stellar wind
- + Origin of the gamma rays?
  - + Strong shock propagating into dense medium around giant star (and stellar wind)
  - + Pion decay or electron processes? (bremsstrahlung)

May 28, 2010 E. Hays

## Summary

May 28, 2010 E. Hays

## Extras

May 28, 2010 E. Hays

## Pulsars everywhere...

- + >50 gamma-ray pulsars so far
- + >40 young, energetic pulsars
- + 9 old, recycled millisecond pulsars
- + Identifying EGRET unidentifieds and LAT unidentifieds
- + Gamma-ray beam is bigger than radio beam
- + Pulsar spectra have exponential cutoffs in the GeV band
- + Gamma rays from outer magnetosphere preferred
- + Bonus: LAT unidentifieds also turning up new radio millisecond pulsars

May 28, 2010 E. Hays
